## Advanced Curve Creator

1. Import curve data: When creating curves with a script, user may choose to import curve data. The curve data may be imported either from scratch or from existing curve files. a. When importing from scratch:  File name: The name of the resulting curve file.  It can be either ASCII or binary format.  Note that you must create the data using Advanced Curve Creator.  If the number of control points in the file is not the same as the number of command points in the drawing, you can use the "-" option to manually calculate the number of command points.  The size of the resulting curve file is 1/1000 of the drawing size.  Create new or overwrite existing curve file in current drawing. b. When importing from existing curve files:  File name: The name of the existing curve file to be imported.  The file size must be in binary format. You can use a binary editor, such as Notepad, to open the file.  There must be a delimiter, such as a "-" or a ".", between each pair of points. This delimiter should be easy to find.  If you know the format of the file, you can also use notepad++ to read the file.  If you import a curve file without checking the "Binary" box, ACC will not import the curve file.  Create new or overwrite existing curve file in current drawing. 2. Parametric Curves: When creating parametric curves, you can manually set the number of control points. If you do not set the number of control points, the curve will contain a default number of control points. This option allows you to change the number of control points. To change the number of control points, click on the "Set" icon. 3. Polar Curves: When creating polar curves, you can manually set the number of control points and the number of total points. If you do not set these two values, the curve will contain a default number of control points. This option allows you to change the number of control points and the number of total points. To change the number of control points and the number of total points, click on the "Set" icon. The total number of points on the polar curve is the number of control points + 1

## What's New in the Advanced Curve Creator?

---

**System Requirements:**

Windows (both 32 bit and 64 bit); Mac OS X; Unix; Android; F.A.Q.; Share the love: For those of you that may be curious about it, here is the kind of system requirements that you should aim for when you play the game. Of course, the more powerful your PC is, the better the game will run on it. The developer recommends that you have at least: A PC with a Quad-Core processor (I think 3.0 GHz is ideal)
