A Python-based utility that enables you to create PDF documents. It includes support for accessing and modifying the PDF document structure. This can be used to produce PDF

documents with embedded Python code, such as a Python tutorial or with data exported from a Python module. You can use it to import external data into the PDF as well.

Installation

There are two versions of pypdg available: pyPdg and pyPdgMk. pyPdg and pyPdgMk are both available on PyPI, but pyPdgMk is in active development only. As of writing this tutorial, only the first version is

available for installation. However, pyPdgMk will become available for installation shortly. pypdg User Guide Accessing and modifying the PDF document structure is the focus of this tutorial. Let's get started! First, let's create our Python module and PDF document.

Create a Python module

Create a new Python module in a Python interpreter and name it PyPdg.py. Load this module. The example

code loads an example PDF document and creates a new Python module in the same directory as the PyPdg.py file. Make a PDF file

Create a new Python module in a Python interpreter and name it PyPdg.py. The example code is the same as shown above. Create a new PDF document in a Python interpreter and name it PyPdg.pdf The example code loads a PDF document, renders it to a

bitmap, and then displays it in a new window. Save a new PDF document in a Python interpreter and name it PyPdg.pdf This will save a new PDF document in your Python interpreter with the name PyPdg.pdf. Add external data to a PDF document Use the PyPdg Python module to save a new PDF document in a Python interpreter and name it BasicStructures.pdf. The example code loads a PDF document, extracts the

PDF document structure,
and exports it as a Python
dictionary. Save a new
